Wireless Energy Transmission
Nicola Tesla “UNPLUGGED”

by
Nick Simos, Ph.D., P.E.
Senior Scientist
Brookhaven National Laboratory

OBJECTIVE

By staying within the framework of the accepted governing physics laws:

- Attempt to arrive to an understanding of how Tesla conceived and planned
- WIRELESS Energy Transmission at his Shoreham Experimental Station
- In particular try to understand the Principles & his Methods
- The objective is NOT to prove or disprove his ideas BUT rather to understand what he was after
- Aim is to steer clear from convoluted concepts which, after all have hurt rather than helped N. Tesla’s scientific contributions and reputation
Resonance ....... and N.TESLA
(a cornerstone of his work)

Heraclitus: “τα παντα ρει ...”
or “everything is in motion”

and Tesla understood that “everything oscillates”
earth
fields (electric, mechanical, etc.)

Finally, N. Tesla in the company of pioneers and immortal scientists

Figure 1.1: The pioneers of electromagnetic theory. From left to right: André Marie Ampère (1775–1836), French physicist. Michael Faraday (1791–1867), English chemist and physicist. James Clerk Maxwell (1831–1879), Scottish physicist and mathematician.

Gerhard Kristensen 2012, Lund, January 30, 2012

Figure 1.2: Immortal scientists of electromagnetic theory. From left to right: Jean-Baptiste Biot (1774–1862), French physicist, astronomer, and mathematician. Heinrich Rudolf Hertz (1857–1894), German physicist. Hendrik Antoon Lorentz (1853–1928), Dutch physicist. Nikola Tesla (1856–1943), Serbian inventor, mechanical engineer, and electrical engineer.

N. Tesla UNPLUGGED - COFE7
Some Background

Maxwell Equations ....... and TESLA

While these form the basis of our understanding of electromagnetism we also accept that inconsistencies (both mathematical and physical) MAY EXIST in them

*Stemming from Abrupt changes or DISCONTINUITIES* (not everything is smooth)

In an effort to understand what Tesla had in mind, resorting to some mathematical formulations and Maxwell Equation solutions will **unavoidable**

(Kept to a minimum but necessary as a matter of record)

In all, we will NOT DEVIATE from the Maxwell Equations Domain (no new physics)

Try to explain everything starting every time from the universally accepted Maxwell governing relations

**Maxwell Equations ......?**

**What are they ?**
All is smooth and easy UNTIL one gets close to abrupt electric and magnetic sources.

Classical Maxwell equations are supposed to be satisfied point-wise at any instant of time. Therefore, discontinuous or diverging solutions are not allowed, BUT …..

Maxwell’s Equations: Ingenious way of explaining the connection between electric and magnetic fields (electric field $E$ and magnetic field $B$)

\[
\nabla \times E = -\frac{\partial B}{\partial t} \quad \text{(Faraday's Law)}
\]

\[
\nabla \times B = J + \varepsilon \frac{\partial E}{\partial t} \quad \text{(Ampere – Law)}
\]

\[
\nabla \cdot E = \frac{\rho}{\varepsilon} \quad \text{(Gauss – Law)}
\]

\[
\nabla \cdot B = 0 \quad \text{(Gauss – Law – magnetism)}
\]

When electromagnetic fields vary with time, we can re-arrange and decouple these relations and express them in forms that describe propagation of waves.

\[
\Delta E(r,t) - \varepsilon \mu \frac{\partial^2 E(r,t)}{\partial t^2} = \frac{1}{\varepsilon} \nabla \rho(r,t) + \frac{\partial J}{\partial t}(r,t)
\]

\[
\Delta B(r,t) - \varepsilon \mu \frac{\partial^2 B(r,t)}{\partial t^2} = -\mu \varepsilon \nabla \times J(r,t)
\]

But is it all Hertz-type? ……. Not necessarily!

Can other types of waves be generated and propagated?

**Longitudinal waves?** Tesla bet on it ⇒ will revisit the point.
To understand how Tesla, while remaining true to the Maxwell governing principles, conceptualized and pursued his goals, we need to go back and start at **Colorado Springs**

**Tesla at Colorado Springs**

Pre-cursor to Wardenclyffe

What did he do there?

What did he observe?

How relevant to his work in Wardenclyffe (Shoreham)?
What did he do there?

A. Wirelessly transmitted electric pulses to large distances
B. Observed the undiminished return of an electric pulse (which he speculated traveled to the antipode and back)

There has been speculation that what Tesla did he excited was resonances of the Schumann Cavity, but did he?

**in his words:**

"This mode of conveying electrical energy to a distance is not 'wireless' in the popular sense, but a transmission through a conductor, and one which is incomparably more perfect than any artificial one.

All impediments of conduction arise from confinement of the electric and magnetic fluxes to narrow channels. The globe is free of such cramping and impediments........"

---

Some Background on the Cavity

Earth and Ionosphere (both conducting, capacitor-like or a cavity that can resonate)

Plenty is happening in the space between:

**Electric field** between this spherical capacitor exhibits characteristic modes when excited

**Electrical discharges can excite them** (lightning is a broadband or white noise excitation exciting all the modes in the cavity)

**BUT why is it important?**

It proves that certain electromagnetic types EXIST

i.e. longitudinal ELF and VLF waves

STANDING waves (modes-like) are formed in the cavity which functions like a wave guide

Solving the CLASSICAL Maxwell Equations one can arrive at the conclusion that both

Longitudinal and Transverse Modes (or standing waves) are present in the cavity
- Longitudinal ~ Cavity mean radius
- Transverse ~ Cavity height

2 orders of magnitude difference between eigenfrequencies

ELF (0-100 Hz) and VLF (0-10 kHz) waves or resonances develop. These are considered LONGITUDINAL Modes

Lightning (or man-made) discharges can EXCITE these modes and especially those considered Extremely Low Frequency (ELF) – including the 7.83 Hz mode

Prof. O. Schumann around 1952 mathematically estimated the 7.83 Hz mode that was soon after (1954) confirmed with measurements

But wait a second …..
According to Wikipedia:

The first documented observations of global electromagnetic resonance were made by Nikola Tesla at his Colorado Springs laboratory in 1899. The observations led to certain conclusions about the electrical properties of the Earth, and which made the basis for his idea of wireless energy transmission.

 Tesla researched ways to transfer power wirelessly over long distances (via transverse and longitudinal waves) transmitting ELF through the earth and as well as between the Earth’s surface and the Kennelly-Heaviside layer (standing waves).

Making calculations based on the experiments, Tesla discovered that the resonant frequency of the Earth was ~8 Hz. In the 1950’s researchers confirmed that the resonant frequency of the Earth’s ionospheric cavity was in that range (later named the Schumann resonance).

Quote:

Physicist Nikola Tesla back in 1890’s was FIRST to experiment with the CAVITY, powerful discharges emulating lightning and exciting ELF waves based on which he “discovered” the resonance frequency of the earth at 8 Hz.

“Unfortunately Tesla was before his time and his discoveries were not taken seriously”

Wireless Transmission with “Schumann Resonances?”

Not quite FEASIBLE, here is why:

• Spherical waves in Cavity or Modes
• Small Q-factor (ratio electric field energy stored in cavity per cycle/average power input)

While Tesla understood the Cavity effect and assessed its fundamental resonance, he did not ride these resonances to wirelessly transfer electric pulses.

So, what did Tesla excite at Colorado Springs?

He disturbed the earth’s electric field (or blanket) with extreme electric discharges

• Electrically excite receivers at great distances
• Observed the undiminished electric pulses return from antipode

Determined a DIFFERENT frequency (not the 8 Hz Schumann fundamental resonance) which will guide his wireless transmission concepts

Determined that time required for transmitted pulse to travel to the antipode and back is 0.08484 seconds ➔ fundamental earth resonance frequency of 11.786892 Hz)

➔ Electromagnetic waves at these frequencies!!! ➔ ELF & VLF shown in Schumann Cavity
Tesla quoting:

Power would be transmitted by creating "standing waves" in the earth by **charging the earth with a giant electrical oscillator** that would make the earth vibrate electrically in the same way a bell vibrates mechanically when it is struck with a hammer. . . ."
Tesla at Shoreham

Wireless power transmission
From Colorado Springs to Shoreham

Fundamental principles underlying Tesla's wireless energy transmission:
(what he counted on)

1. Low frequency alternating current can be transmitted through the earth with low loss
   (net resistance between earth's antipodes <1 ohm)

2. Low frequency, high voltage alternating current via electric displacements by
   a) electrostatic induction, b) electrical conduction, or a combination of the two

3. Earth's naturally existing electrostatic potential (electrostatic field)
   400,000 V potential with ionosphere
   Downward directed \textbf{E-field of about 100 V/m} near surface
   \textbf{ability to create disturbances in this charge} as annular distortion of the
   background electric field

AIMED AT TWO (2) Methods, or Circuit Types, namely
   • \textbf{OPEN CIRCUIT} \Rightarrow Earth Resonance
   • \textbf{CLOSED Circuit} \Rightarrow Atmospheric Conduction
How do his two concepts work?

CENTRAL to Tesla’s concepts is the Capacitor Principle

He is envisioning however a capacitor of enormous proportions

In a typical capacitor (energy indeed transfers wirelessly across the two plates through the dielectric) AC current jumps the gap that is between 1/6-1/2 wavelength.

Because AC frequencies are high so wavelengths are small and GAP is small

In Tesla’s model the two distant elevated terminals are electrically coupled together in a manner similar to the transfer of electrical energy between two closely spaced capacitor plates but at distances greatly exceeding 1/6 - 1/2 wavelength

His concept/model, at first glance, considered to be inconsistent with mainstream physics UNLESS different types of waves between the plates can be excited!!!!!!

Need to have receiving capacitor plate to resonate with its counterpart

TESLA Coil and System: What is it?

A capacitor and some other stuff!!!

The wireless system is comprised of two sympathetically tuned electrical oscillators

RF power supply connected to a grounded top-loaded helical resonator

Distance apart many wavelength’s (unlike capacitor !!!)

Primary coil connected to power source

Secondary (pancake) coil and connector to capacitor plate:

→ high voltage and selected frequency (harmonic of 11.78 Hz)

Ionization of air between capacitor plates:

→ excitation of LF longitudinal modes or waves
Tesla’s Earth RESONANCE Method
Open Circuit working principle – Earth Resonance Method

A Tesla coil earth resonance transmitter creates a local disturbance in the earth’s charge

**He is now zooming-in to not simply excite the earth’s electric field with a broadband source BUT with a source that** operates at some harmonic of the earth field-resonance (~11.78Hz)

**Such source is the basis of Tesla’s earth resonance method.**

The receiver (from the two Tesla coils) is **Passive**

**Earth’s electric field resonance will provide the synchronization of the receiver!!!**

---

Recall that Tesla estimated that the fundamental earth resonance frequency is of the order 11.78692 Hz.
That came from his Colorado Springs work! So, there is the connection!

---

Governing Principles in Resonance Method

Medium between similar coils (transmitter and receiver)?

Types of waves it can support (VLF, ELF)

Longitudinal waves ??? (not Hertzian) → debate
How will Tesla’s Resonance System look like?

Receiver will be tuned transmitter and will be excited by the field distortion, itself excited by the transmitter at the same frequency.

Same thing, only electrically.

Open Circuit working principle – Earth Resonance Method (continued)

System MUST operate at some harmonic of the earth-resonance frequency (~11.78Hz)

Receiver waiting to be SYMPATHETICALLY activated, once it does, NEEDS to draw load (transfer of energy).

Success of the method rides on the ability of the transmitter to excite and induce waves in the medium between them OTHER than of the Hertz-type.

Let’s go back to Maxwell’s Equations and take a closer look.
Longitudinal and Transverse Waves

START from the fact that any vector field (finite, uniform, continuous) can split into longitudinal and transverse fields

\[ F = F_\perp + F_\parallel \]

\[ \nabla \times F_\parallel = 0 \]

\[ \nabla \cdot F_\perp = 0 \]

\[ \nabla \cdot D_\parallel = \rho(r,t) \]

Maxwell equation for the long. part of electric displacement field

Which after some mathematical manipulations leads to:

\[ D_\parallel(r,t) = \frac{1}{4\pi} \int \rho(r',t) \frac{r - r'}{|r - r'|^3} d^3r' \]

\[ E_\parallel(r,t) = \frac{1}{4\pi\varepsilon} \int \rho(r',t) \frac{r - r'}{|r - r'|^3} d^3r' \]

(Source: J. Nitsch, et al, Equivalent Circuit Method)

N. Tesla UNPLUGGED - COFE7

Longitudinal and Transverse Waves

Above is an interesting finding which says that the longitudinal electric displacement \( D_\parallel \) and electric strength \( E_\parallel \) are fully coupled to the instantaneous Coulomb charge !!!

\[ E_\parallel(r,t) \leftrightarrow \rho(r',t) \]

Or, whatever the SOURCE is doing at \( (r', t) \) the field is doing at \( (r, t) \):

That is CRUCIAL !!!!

If the source is oscillating with a frequency \( f \) so will any point on the domain \( \Rightarrow \) receiver will oscillate sympathetically at the same frequency (which is made to be identical to that of the transmitter)
Parenthesis

Attempt to see if the types of waves Tesla was counting on can be generated

Interesting solutions due to charge/current singularities

Consider one of the “wave-like” equations

Laplace transform on \( \tau \)

In 3-D space

\[
E = -\delta[\tau - t - (r/c)] \sqrt{4\pi c^2 r}
\]

In 2-D space

\[
E = \begin{cases} 
  1 & r > c(t-t) \\
  \frac{1}{2\pi c^2 (\tau-t)^2 - r^2} & r < c(t-t)
\end{cases}
\]
“Near-field” a and “wave-zone” effects

Hertzian Oscillator – Dipole Antenna
At point \( P \) with a stationary positive charge +\( e \) and an oscillating negative charge –\( e \) (about \( P \)) forming a dipole

\[ E = \frac{e}{4\pi R^2} (R_1 - r_1) + \frac{f[R, \vec{p}]}{4\pi c^2 R} \]

Near-field Wave-zone

So, even an oscillating dipole induces a near field !!!!

Let’s revisit the solution from a discharge that Tesla was doing in Colorado Springs

\[ E = -\delta (\tau - t - (r/c)) / 4\pi c^2 r \]

From singular discharge

\[ E = \frac{e}{4\pi R^2} (R_1 - r_1) + \frac{f[R, \vec{p}]}{4\pi c^2 R} \]

From oscillating dipole

Well, what is under debate is how far from the source inducing the electromagnetic waves the two types separate

It can be said that it depends on the disturbance, or source-type
RECEIVER Responding INSTANTLY?

It can only happen if the Transmitter EXCITES a mode of the field (standing wave)
ONLY then the field will be disturbed instantly!!!

and Tesla AIMED at exactly that:

Hence, RIDE the fundamental mode of the earth electric charge field OR a multiple harmonic of it

Tesla’s ATMOSPHERIC CONDUCTION Method

Closed Circuit Method
Atmospheric Conduction

What will the system look-like:

- **Tesla coil transmitter**
- Ionized path connecting the transmitter to the upper atmosphere
- Ionosphere
- Ionized path connecting the upper atmosphere back down to receiving location
- Tesla Coil (receiver)
- **Closed circuit is completed with current back to the transmitter through the earth**

**Electrostatic induction instead of true conduction**
Electrical displacement or the passage of electrical energy through space other than the application of voltage potential

**High voltage and low current**

*N. Tesla UNPLUGGED - COF7*

DETAILS of the Atmospheric Conduction Method

- An oscillating electric field is induced by High Potential RF current applied to the HELICAL Resonator of a Tesla coil (oscillating magnetic field $\Rightarrow$ oscillating electric field)
- A plasma state is formed in the High Voltage Terminal (capacitor plate) making it conductive
- **Current is pushed in the 10,000,000 to 12,000,000 volts line created to the upper strata (high voltage will minimize loss due to plasma transmission-line resistance)**
- An **ionizing beam of ultraviolet radiation** will also form a high-voltage plasma transmission line
- If a plasma state is induced in the upper troposphere (part of the scheme) then that becomes a conductor
- End result is a flow of true conduction currents between transmitter and receiver

The process relies on **plasma waves** developing in the ionized region between the two terminals (electrostatic waves or magneto-hydrodynamic waves)
### Longitudinal Waves and Maxwell Equations

**Electrostatic or magneto-hydrodynamic plasma wave model**

**Electrostatic Waves (K. T. McDonald, An Electrostatic Wave)**

**Assertion:** A time-varying purely ELECTRIC field \( E(r,t) \) can exist and propagate as a longitudinal wave WITHOUT coupling to a time-varying magnetic field

\[
\nabla \times E = 0 \quad \frac{\partial B}{\partial t} = 0
\]

**But under the Conditions:**

- Electric Displacement \( D \) is zero in a plasma medium

These **Longitudinal electric waves** can coexist with background electrostatic and magneto-static fields

**Maxwell Equations**

\[
\begin{align*}
E &= E_x \hat{x} e^{i(k_x-x-\omega t)} \\
E &= -\nabla V \\
V &= \frac{i}{k} E_x e^{i(k_x-x-\omega t)} \\
\rho &= -\nabla P
\end{align*}
\]

**Further analysis reveals that the longitudinal waves can only have the plasma frequencies!**

**We did observe the same in the separation of transverse and longitudinal waves of Maxwell’s equations**

---

### So, what happens at the receiving end .......?

**COUPLED Transmitter and Receiver** ➔ Transmitter “feels” the load in the receiver

**ENERGY SUCKING ANTENNAS and TESLA**

**Parallelism with ATOMS (1 Am) strongly interacting with LIGHT (5000 Am wavelength)**

Flood the atmosphere with standing waves (ionosphere keeps most of this EM energy from escaping into space) then a small resonator can grab significant wattage right out of the air (effective disk in figure)

**A small resonator** can produce an extensive and intense AC field of its own, and can act as an “EM funnel” (simple desktop experiments demonstrated it !!!)

This is "circuitry", where wavelength is huge, and circuits are small

**As one said:** “This is probably the concept that put that "Mona Lisa grin" on photographs of old Nikola. And that twinkle in his eye...”

---

N. Tesla UNPLUGGED - COFE7
How Feasible or Workable is Tesla’s Concepts?

**Resonance or Open Circuit Method:**

Tesla’s model involves two very distant, electrically coupled elevated terminals (capacitor plates) in a manner similar to the transfer of electrical energy between two closely spaced capacitor plates in a typical AC circuit, but at distances greatly exceeding 1/6 - 1/2 wavelength.

This model considered to be inconsistent with a basic tenet of mainstream physics (related to the scalar derivatives of the electromagnetic potentials).

So we thought, BUT “Witricity” is proving to be otherwise.

MIT tests and Resonant Inductive Coupling distances > ¼ wavelength maybe not the distances Tesla envisioned BUT much greater than what was thought as the threshold of a capacitor.

---

**Atmospheric Conduction or Closed Circuit Method:**

Model has no inconsistencies.

It also involves two very distant, electrically coupled elevated terminals (capacitor plates) that are both active and rely on in electrostatic induction alone.

It also involves the ionization of the space between the two “capacitor” plates which in turn (being in a state of plasma) will permit ELF and VLF waves.

While consistent, it may be impractical for its size. Maybe!
Let the future tell the truth, and evaluate each one according to his work and accomplishments.

The present is theirs; the future, for which I have really worked, is mine.

Nikola Tesla

It is possible then that our future already lies in our past

........... all we need to do is continue connecting the dots
